Perform small leak verification test, the ESIM is used by the PCM for the leak detection, however this test uses fuel tank pressure sensor in order to determine if the vehicle has a small leak, this is accomplished by monitoring the fuel tank pressure change over a period of time. There are 5 different possible phases and all had to be followed. Phase 1 check stability of system. Phase 2A check if pressure is changing too fast. Phase2B check for system small leak by monitoring tank pressure over time. Phase 3 check for a leak in the purge solenoid, this test failed because of leaking purge solenoid replace purge solenoid and redo test. Phase 1, 2A, 2B, & 3 test ok

Work Order History - Custom

Asset	WO #	Meter 1	Closed Date	Work Code
				during this time, Phase 4 pull fuel tank pressure down to -600PA however this test failed because the ESIM switch state never change, the ESIM as it could be the cause of the small leak, check switch operation on scanners seems to be working, check wiring "OK" remove & replace ESIM switch. Perform small EVAP test again all 5phases where completed OK Phase 5 intrusive small leak test. Re-flash PCM & HVAC clear codes, scan tool had to be updated before being able to communicate to unit & one more time for the re-flash.
